Subject: civic education, introduction to block programming

Content: discover the Sustainable Development Goals (SDGs), link the SDGs to students' daily lives (water, waste, biodiversity, equality), use MakeCode Arcade as a tool to express a civic message

**Computational practices:
choose what fits**

- **Decomposing**
- Pattern recognition
- **Abstraction**
- **Algorithms**
- **Problem solving**

Unplugged/plugged: **plugged**

Preparation time:
60 min

Age:
7-12 years

Duration:
2h30 or 3h

Location:
In the classroom

Group distribution:
In group

Difficulty

After this lesson, children will be able to...

- Understand global issues and connect them to daily life: they will recognize that Sustainable Development Goals (SDGs) represent challenges—such as water, waste, pollution, or equality—that also affect their own school, city, and family. They will express their feelings and reactions to these issues and learn to articulate them.
- Express a civic problem as a story or rule: they will translate a real-world problem into a simple game mechanic (e.g. recycling = catching the right object, pollution = avoiding obstacles). They will practice distinguishing positive from negative actions and understand the role of rules in community life.
- Collaborate in a collective project: they will work in groups to design a mini-game, taking turns as designer, coder, tester, or presenter. They will demonstrate autonomy, cooperation, and responsibility toward others.
- Communicate their civic message: they will present their game, explain the SDG it illustrates, and reflect on the moral choices it highlights. They will evaluate and compare different approaches, discuss alternatives, and practice critical thinking.

INTRODUCTION

A CREATIVE JOURNEY IN BLOCK-PROGRAMMING

Introduction to MakeCode Arcade

MakeCode Arcade is an educational platform developed by Microsoft, designed to introduce students and educators to programming through the creation of video games. Accessible online, it offers a rich and intuitive environment where users can design, customize, and share their own games. MakeCode Arcade's interface is suitable for all levels of programming experience, offering both a so-called "block-based" mode for beginners and a text-based mode for more advanced users.

MakeCode Arcade is not just about creating video games: **it offers a free and creative space where students can tell stories, create animations, and bring their ideas to life.** This flexibility allows them to fully express themselves, test innovative concepts, and develop interactive narratives that reflect their imaginations and interests.

Committed to inclusive and innovative pedagogy, MakeCode Arcade **empowers students to experiment, learn, and grow while positively contributing to their community.** Using a Skill Map approach, the platform offers a personalized and progressive learning path, incorporating gamification elements such as unlockable achievements and visual progress indicators. These tools motivate users to explore, acquire specific skills, and visualize their progress in a fun way.

Interest in block programming

Block-based programming is a **simple and visual method for creating digital projects** without the need to know a complex programming language. Instead of writing code with text, students use colored blocks, which resemble puzzle pieces, to construct logical actions and sequences. Each block represents a command or action, such as "move a character," "play a sound," or "count to 10."

By assembling them, a program is created that works smoothly and intuitively. This approach helps students understand the **basics of programming by manipulating concepts in a concrete and fun way.** Block-based programming is particularly suitable for beginners because it **reduces errors and frustrations** associated with writing code. It allows them to focus on logic and creativity, making technology accessible and fun, even for those who have never programmed before.

Pedagogical intent

The purpose of this activity is to introduce pupils to programming through a **creative and meaningful context.** By linking block programming with the creation of interactive stories and games on civic issues, we ensure pupils' engagement: **they are not coding for its own sake, but to express ideas, collaborate, and share messages that matter to them and their community.**

Materials needed:

Access to introductory games/resources:

- Printed SDG pictograms (UN resources).
- Go Goals board game – playful entry to SDGs.
- Unplugged Quest – unplugged activities around SDGs.
- Paper, pencils, markers for storyboarding.

Access to MakeCode Arcade (<https://arcade.makecode.com/>)

- Computers or tablets with internet access.
- If available, projector/smartboard for demonstrations.

Helpful links:

- Go Goals! Board Game (UN) – SDG discovery game for children - <https://go-goals.org>
- Unplugged Quest – unplugged SDG activities - <https://unplugged-quest.eu/>
- UN SDG Icons and Materials (official pictograms and posters) - <https://globalgoals.org/resources>
- UNESCO – Learning about sustainable development from an early age - <https://www.un.org/sustainabledevelopment/student-resources/>
- UNESCO – Educational Materials for SDGs - <https://www.unesco.org/en/sustainable-development/education>
- York University – SDG Educator Toolkit - <https://www.yorku.ca/unsdgs/toolkit/teaching-the-17-un-sdgs/sdg-resources-for-the-classrooms/>

Preparation teacher notes

and

Print or project SDG pictograms (without text for the guessing exercise). Prepare a few relatable examples yourself in case students need prompting. Encourage open discussion and validate all reasonable answers, even imaginative ones, as a way to show that the SDGs touch many aspects of everyday life.

Warm up – Discovering the SDGs (30–40 min) - Unplugged activity

During the warm-up phase of this lesson, the objective is to make students discover the Sustainable Development Goals by connecting them with their own experiences and emotions. The final objective being to build sensitivity around these global issues and make them tangible for the youngest students.

Activity A – Introducing SDGs with pictograms (10 min.)

Begin by displaying the SDGs pictograms to give the children a visual entry point to these challenges.

Show them the different icons without text and ask them to identify, according to them, which societal challenge is covered by the SDG.

Once all SDGs discovered by their icons, question the class to identify relatable situations in their daily life linked to each of them. For instance:

- SDG 2 – Zero Hunger: Not wasting food in the school cafeteria, sharing snacks with classmates.
- SDG 7 – Affordable and Clean Energy: Turning off lights when leaving a room, unplugging devices not in use.
- SDG 10 – Reduced Inequalities: Including everyone in games, respecting classmates with disabilities, welcoming new students.

With this first level activity, students begin to recognize “big global challenges” that can be visible in their daily lives. This creates sensitivity and awareness.

Preparation teacher notes

and

Print game boards or storybooks in advance. Organize the class into small groups for board games or circle time for storytelling. Be ready to pause and ask reflective questions, such as "How does this problem relate to our lives?" or "What could we do to help?"

Activity B – Playing with SDGs (20-30 min.)

Once the SDGs have been discovered by the learners, use playful activities to interact with them. Learning through games is offering an environment in which students can explore, understand and interact with the concepts to acquire. Playing can strengthen critical thinking, cooperation and problem-solving while having fun.

Regarding the SDG context, which can seem pessimistic to the youngest due to the numerous challenges to approach, bringing the playing component can help students to face these issues in a creative, collective and positive way while preparing them becoming engaged and active citizens.

Launch creative workshops and game sessions in the classroom to discover the SDGs by living them. You can use the following resources (non-exhaustive list) to inspire yourself and find the appropriate activities corresponding to the time you have and the age of your pupils:

1. Explore the resources from UNESCO

- **Go Goals! Board Game** - Go Goals! is a board game created by the UN to help children discover the SDGs in a simple and friendly way.

By answering questions, rolling dice, and moving pieces, students practice cooperation and learn facts while having fun. <http://go-goals.org/>

- **SDG Book Club** - The SDG Book Club uses curated books for children ages 6–12 to introduce each of the 17 SDGs. Reading stories from around the world helps learners connect emotionally to civic issues. It encourages empathy and imagination, while also giving a human face to global challenges. <https://www.un.org/sustainabledevelopment/sdgbookclub/>
- **Frieda** - Frieda is a storybook following a child in Namibia, designed to simplify SDG concepts for young children. Through her journey, students encounter themes of protecting life on land, the importance of water, and environmental stewardship. Storytelling helps children remember civic lessons and virtues, embedding them into everyday thinking. https://issuu.com/unpublications/docs/frieda_2018

Preparation and teacher notes

Access game guides and print instructions from the [Unplugged Quest website](#). Prepare physical materials needed (cards, recipes, simple props). Assign observers to groups where necessary to help monitor cooperation and fairness. After each game, run a short debrief to link back to SDGs and everyday experiences.

2. Explore other game resources - Example of the Unplugged Quest

[Unplugged Quest](#) is an Erasmus + Project aiming to participate in the development of citizenship education as a set of knowledge, skills and attitudes that allow children to recognize the values necessary for living in the community. To reach its pedagogical commitment, Unplugged has created a game-based learning ecosystem dedicated to societal challenges. The platform proposes a variety of games, each focusing on a specific civic issue like equality, solidarity, diversity, or sustainability. Teachers and educators can compose their own learning pathway by selecting and combining games according to age, time available, and targeted competences. This flexibility makes Unplugged Quest a playful entry point into SDGs and civic education.

Examples of games:

- *Equal: The Equal Game encourages reflection on gender stereotypes and equality. Through playful scenarios, learners identify biases and explore the idea that opportunities should be available to everyone regardless of gender. It strengthens awareness of inclusivity and respect.*
- *Cookies for Peace: In this role-play cooking activity, groups of students must bake cookies. However, resources are unevenly distributed: some groups have too much, others too little. The aim is for groups to negotiate and share in order to succeed. The game highlights inequalities in resource distribution and stresses the importance of solidarity and cooperation.*
- *PotLuck March: In this simulation game, each player receives random "energy points" based on food cards. Some children get abundant food (more energy), others get little or none. Players can only move forward if they have enough energy. The activity makes visible the inequalities of food access and encourages collaboration: players with more must decide whether to share with those who have less. The ultimate goal is to get as many players as possible to the finish line, reinforcing the idea of collective responsibility.*

<https://www.unplugged-quest.eu/games>

welcome to the *unplugged* metaverse

Enter the game ... and explore your citizenship

Preparation and teacher notes

Provide varied artistic materials such as paper, markers, paints, glue, and recycled objects. Allow sufficient time for brainstorming before creation. Remind students to represent both the problem and the solution to emphasize active citizenship. Conclude with a gallery walk, where students explain their work and react to others'.

3. Use artistic component to feel the SDGs

Another powerful way to “feel” the SDGs is to transform the classroom into an art gallery. You can divide the classroom in groups or make it an individual work distributing the SDGs to create posters, drawings, or collages inspired by an SDG.

Each pupil can choose a medium: recycled materials, painting, collage, photography ... The goal is to produce an artwork that symbolizes both the challenge (the “issue”) and the solution (the “positive action”) linked to their SDG.

This turns learning into civic expression and makes the SDGs visible to the whole community. Beyond artistic practice, the activity strengthens sensitivity, judgment, and engagement: children learn to connect emotions, ideas, and civic responsibility.

Preparation teacher notes

and

- Prepare a simple mission statement on a poster or slide ("Your mission: create interactive and playful stories that allow your friends and family to step into the world of the SDGs").
- Use the printed SDG icons from the warm-up phase to help pupils visualise their choices.
- Provide storyboard or worksheet templates with the "Once upon a time..." hero sentence and guiding questions: What is the civic message? What positive action? What danger? What rule?
- Plan how pupils will position themselves into groups and agree collectively on the order of SDGs stories. **A large board or floor with SDG cards that pupils place in sequence works well to co-construct the storyline.**
- For exploring more in details storyline and storyboard, you can also use the "Curry Quest" Lesson Plan.

Build up – Make interactive stories (1h45–2h – Can be done on several sequences)

Based on the understanding of SDGs challenges acquired in the warm-up phase, the build-up phase offers a space for learners to explore dynamically societal challenges. The objective being to increase their critical thinking in civic education.

Activity A – Reflecting and brainstorming (20 min.)

Give the pupils the general assignment of this phase:

Now that you have experienced the importance of the SDGs through play, it's your turn to help others discover them. Your mission: create interactive and playful stories that allows your friends and family to step into the world of the SDGs."

1. Come up with the storyline

Starting with a shared storyline gives coherence and motivation to the entire project. Instead of producing disconnected programs, the objective is for the pupils to co-construct a collective universe in which each group's work becomes a "level" of one grand adventure. Embedding SDGs into a story makes abstract goals tangible and memorable. A hero traveling through the "world of the Goals" allows children to project themselves into situations of justice, sustainability, or solidarity.

Simplifying the journey: The hero does not need to travel through all 17 Goals. With the teacher's guidance, the class can select a subset of SDGs that are the most relevant to pupils' age, context, or ongoing school projects (for example: SDG 3 – Health, SDG 4 – Education, SDG 6 – Clean Water, SDG 12 – Responsible Consumption, SDG 15 – Life on Land). This makes the storyline more coherent and manageable, while still keeping the collective logic.

Complete the mission statement with the class: **"The hero must travel through the SDGs. Who is the hero? What is the mission?"**. Guide this discussion and write down the agreed narrative on the board. Use simple storyboard practice to help students visualize the overall story, keeping it simple to enable pupils to reach their expectations using MakeCode Arcade:

"Once upon a time, there was a hero named ____ motivated by _____. He/She valued _____ and always stood for _____. Our hero was known for qualities such as _____ and had the special ability to _____. But even heroes have weaknesses, and his/her vulnerability was _____."

Preparation teacher notes

and

- Train yourself on MakeCode Arcade by using the tutorial given in appendix. Have fun and create your own project to inspire your pupils!
- Test computers and internet connection before class. Open MakeCode Arcade and ensure Skillmaps load.
- Have a projector ready to demonstrate the first few clicks (open Skillmaps, select tutorial).
- Allow pupils to follow the Skillmap sequence at their rhythm, but "Full of Stories" first.
- Remind them to note what they discover: blocks they like, effects they find useful, or features they might reuse for their own story.

By co-creating the storyline and narrowing the scope, pupils will develop a sense of ownership and responsibility. They also learn that civic engagement does not mean solving everything at once, but starting with focused actions that matter in their daily lives.

After the collective storyline is established, pupils are invited to position themselves in small groups. Each group, with the help of the teachers and agreement with the class, can choose the SDG, the part of the story they want to work on, according to their interest and creativity. Some may want to create a story around water, others a game around equality, others can work around protecting nature. The essential aspect is that everyone contributes to the same story. Each chosen SDG becomes one step in the hero's journey, for which each group will design the challenges that the hero must face. The order of the levels is then agreed upon collectively, making sure the adventure keeps a coherent progression.

Activity B - Preparing their program - First step in MakeCode and brainstorming (1h)

To be able to develop their interactive stories or games, pupils will be introduced to MakeCode Arcade, a programming software enabling to generate simple animated stories using arcade gaming mechanics. In addition of bringing to life their stories, it will enable making them discovering block-programming in an engaging way. The second activity aimed then:

- at discovering the tool for pupils to make their first steps in block-programming with the appropriate guidance;
- at analysing how their ideas can fit with the features offered by MakeCode Arcade;
- at defining their contribution to the storyline, by combining the technical possibilities with their creative ideas.

Start with showing them some videos, tutorials and programs created on MakeCode Arcade on Youtube:
https://www.youtube.com/channel/UCye7YlvFUUQ1dSy0WZZ1T_Q

Because classroom equipment is often limited, activities are organized in parallel: some pupils use computers to discover MakeCode, while others continue to brainstorm and sketch their ideas. They rotate to be able to reach their goals through this step: learn to use the software and identify how it can enable making their ideas tangible.

Preparation teacher notes

and

- Provide paper, markers, and SDG icons for inspiration.
- Encourage sketches: characters, backgrounds, or simple flow diagrams.
- While groups work, circulate and help them link abstract ideas to simple rules (e.g. "You want to talk about waste sorting: how could that be a catch/avoid mechanic?").

- Encourage pupils to start simple. Complexity can be added later.
- Prepare a step-by-step checklist on the board (e.g. Step 1: Create your hero, Step 2: Add one positive element, Step 3: Add one danger, Step 4: Define a rule).

1. MakeCode Arcade rotation: The group of pupils discovering MakeCode Arcade will start by using the **Skill Maps** (see tutorial in the appendix). These guided programs will enable the pupils to discover each of the features of MakeCode Arcade, in particular to identify all the blocks available. The workshop should **at least last around 15 minutes**. Let the pupils explore the list of Skill Maps **freely and at their own rhythm**: they start with the first one called "Full of Stories", then "Whack the Mole", "Talent Show"... until the time dedicated to the first rotation is done.

2. Brainstorming rotation: While part of the pupils are working on MakeCode Arcade, the second part will be working in groups to enrich their storyline with their ideas for their interactive story or game on their given SDG. As teachers, you can provide pupils with guided questions to stimulate their ideas: What is the civic message they want to give through their interactive program? What positive action should be promoted? What danger should be avoided?

Remind pupils that MakeCode Arcade is not limited to building classic video games. They can also create interactive stories, musical experiences, or small scenes where characters act out a situation. The important point is that each project communicates a civic message linked to an SDG. The format (game, story, scene, or music) can vary depending on pupils' creativity.

Once the first rotation is finished, make pupils change their roles so everyone will have discovered the features of MakeCode Arcade thanks to Skill Maps.

3. 10 minutes for finalising ideas: at the end of the last rotation, make groups meet again to conclude on their final ideas before starting programming their own interactive program by themselves.

Activity C - Programming the story (30-40 min.)

Once pupils are comfortable with the environment, they move to programming their SDG level. This step aims to bring together programming skills, civic reflection and digital creativity: pupils learn to code, in a way to express themselves, not focusing only on the technical experience.

Each group begins by creating the minimal elements of their story: **their main character, a positive elements (clean water, recycled object, tree ...), one challenge (pollution, waste, injustice ...) and an interactive element (score, scene change, music ...).**

Preparation and teacher notes

- Circulate and ask guiding questions that connect civic message to code: "What happens when the hero touches pollution? How will the player know it is bad?"
- Remind pupils to test often and to share their game with peers to check whether the message is clear.
- Provide sticky notes or journals for pupils to document their process (moments of difficulty, solutions found, successes).
- Keep track of timing: pupils will want to "add everything" but the focus is on clarity of civic message, not technical perfection.

Once the basics are working, pupils can enrich their programme by experimenting with features they discovered in the Skill Maps: **backgrounds and settings that reflect the SDG (city, forest, school), sound effects with triggers, dialogue boxes, timer...**

As a teacher, encourage pupils to regularly test their programmes, within their team but also with their classmates to check the clarity of their message and the interactivity. They can adjust elements step by step, learning that programming is mainly about trial, error, and improvement.

Encourage them to document their choices by taking notes of **each moment of disappointment and each moment of joy they encounter in the programming process.**

By the end of this activity, each group will have produced a playable prototype or an interactive story that illustrates their chosen SDG. The quality of the programme may vary, but the focus is on the clarity of the civic message and the creative use of MakeCode Arcade features. Pupils will also have experienced teamwork, decision-making, and the process of iterating on a project.

Preparation and teacher notes

- Prepare the space: Arrange the classroom so that every group can present easily. Connect one computer to a projector for the whole class to view the projects. If devices are limited, organise short rotations so that groups can try each other's programs.
- Set the tone: Present the rehearsal as a celebration rather than an evaluation. Emphasise that every project is a valuable part of the collective storyline, no matter how simple or advanced.
- Guide feedback to ensure it is constructive and focused on the clarity of the civic message.
- Celebrate diversity: Remind pupils that not all outputs have to be games. Highlight the variety of creations (stories, music, scenes, animations) as strengths that enrich the collective SDG journey.
- Extend the showcase: Plan ahead if you want to open the session to another class or to parents. A short "SDG Arcade Festival" can be organised by projecting all programs in sequence or by preparing a QR-code wall where visitors can scan and play the games.

Rehearsal – Sharing and Celebrating (15 min.)

The rehearsal phase is the moment when pupils **showcase their interactive stories or games and see how their work connects to the collective storyline**. Each group presents its creation to the rest of the class, who play, listen, or watch and then try to identify which SDG is represented. This peer exchange allows pupils to test whether their civic message is clear and whether their interactive program communicates the intended idea. The rehearsal is also an opportunity for the whole class to appreciate the diversity of approaches: **some groups may have built a game, others an interactive story, a musical sequence, or a short animated scene, but all contributions are equally part of the collective adventure**.

To make the session engaging, the teacher can frame it as a friendly **"festival of SDG stories,"** where each project is celebrated. Pupils should be encouraged to give constructive feedback, for example by saying what they understood, what they enjoyed, and what could be improved.

This showcase does not have to remain within the class. Projects can also be presented to **another class in the school, or to parents during a collective projection event**. In this way, pupils take **pride in sharing their work** with a larger audience, and their digital creations become a tool for spreading awareness of the SDGs within the whole school community.

Clean-up

At the end of the session, pupils save their programs and tidy the classroom. Conclude with a short reflection: "What did we learn about the SDGs? What did we learn by using block programming?" Pupils recognize that block programming is not just technical but a creative way to express civic messages and design playful solutions for real-world issues.

MAKECODE ARCADE TUTORIAL

Features

The main features of MakeCode Arcade are:

- **Easy-to-use interface:** MakeCode Arcade offers a simple interface where students create games using code blocks, like a puzzle, making programming fun and accessible.
- **Guides and Tutorials:** The platform offers numerous tutorials and step-by-step lessons, helping students learn how to use the tools and understand game programming.
- **Skill Maps Tool:** Skill Maps are guided learning paths where students follow steps to learn new skills. With badges and levels to unlock, this makes learning motivating and engaging.
- **Sharing and community:** MakeCode Arcade allows students to share their creations and discover each other's games, promoting exchange and collaboration.
- **Game Console Compatibility:** In addition to playing in the browser, created games can be transferred to small game consoles, allowing students to play their creations on physical devices.

Getting Started with Skill Maps

Skill maps are visual guides that show the steps to achieving a goal, such as creating a game in MakeCode Arcade. They break down skills into small levels, allowing you to track your progress, see what you've learned, and what you still need to learn. These cards are easy to follow and allow students to learn at their own pace. As they progress through the Skill Maps, they discover programming basics like loops, variables, and conditions, while having fun creating games. Skill Maps aren't just about coding: they also include design, storytelling, and rule-making skills, so everyone can develop their own ideas. They are designed to be engaging and tailored to each student's interests, making learning fun and accessible to all.

Steps to follow to discover Skill Maps

Step 1 - Access Skillmaps

- Open MakeCode Arcade  <https://arcade.makecode.com/>
- Identify the "Beginner Skillmaps" space located just below the "New Project" button.

Step 2 - Explore the Maps

Browse the different maps available, listed in order of complexity. If you're new to MakeCode Arcade or creating an activity for the first time, discover MakeCode Arcade for yourself by creating the "Full of Stories" skillmap to discover the most commonly used blocks  <https://arcade.makecode.com/--skillmap#story>.

Step 3 - Discover the levels

As you can see in the "Full of Stories" skillmap, each map is divided into levels. This helps manage complexity while still providing the young coder with satisfying intermediate steps, thus stimulating creativity, engagement, and the desire to progress to the next level.

Step 4 - Discover the learning objectives

When you open a skillmap page, you will find, on the right side of the screen, an overview of the content, the number of steps, the rewards to be acquired and a link to the learning objectives.

This link leads to a page dedicated to educators and parents, outlining the activities contained in the skillmap and the objectives to be achieved. For example, in the "Full of Stories" skillmap, young coders will discover activities in design, storytelling, integrating effects, music, and event management.

Step 5 - Understanding the blocks using the tutorials

When you complete a step in a skillmap, you will be guided by a tutorial on the left of the screen, which will allow you to identify which drawers and blocks should be used and for what purpose.

The tutorial also includes more informative elements about blocks, for example: what is an event, what is a loop... These elements allow you to acquire the skills and knowledge necessary to later carry out projects from scratch.

Step 6 - Create maps, track progress, collaborate and share

Once you've started your skillmaps, you can easily track your progress thanks to the gamification of the MakeCode Arcade interface.

Each skillmap is divided into stages, leading to the achievement of rewards.

At the end of the map, you will receive a certificate of completion, adding an extra level of gamification to the approach to programming via MakeCode Arcade.

You can finally share your achievements with the community, parents, educators and other participants.

Step 7 - Change Level

If the "Full of Stories" skillmap is too simple for your participants, explore the following maps.

"Next Level Skillmaps" are also available to move to a higher level of complexity, via the MakeCode Arcade home screen, under "Beginner Skillmaps".
