

Teacher Training Programme in Belgium

Teacher Training Programme in Greece

Robots Meet Arts Teacher Training Programmes Across Europe

As part of the Robots Meet Arts project, partners have been actively delivering teacher training programmes aimed at empowering educators to integrate computational thinking, robotics, and coding into the teaching of arts and humanities. These trainings combined theory and hands-on practice, with a strong emphasis on creativity, cross-curricular learning, and inclusive education. Below, we highlight key training initiatives carried out in France, Greece, Spain, and Belgium.

In **France**, L.A.B, in collaboration with INSPÉ Créteil, organised a four-day teacher training programme, between March and May 2025. The training offered 22 primary school teachers in practice the opportunity to explore how computational thinking and unplugged coding activities could enhance the teaching of humanities subjects such as languages, history, geography, and the arts, while fostering creativity and inclusion. Participants discovered the core principles of computational thinking, experimented

with a variety of unplugged and plugged activities including choreography coding and narrative mazes, discussed inclusive teaching strategies through dedicated reflection simulation games, and worked collaboratively to design and present original cross-curricular learning scenarios integrating computational thinking into their classroom practice. This training programme will be followed by a second session towards 30 more teachers to be held in Paris in January 2026.

In **Greece**, Stimuli for Social Change in collaboration with the Primary School of Platy, organised a two-day teacher training programme on 3–4 September 2025. Participants became familiar with basic principles of robotics and programming, experimented with a range of educational robots (Lego Spike, Vinci Robot, Beebot, Robot Mouse, etc.) and programming environments (e.g., Scratch, Scratch Jr.), discussed inclusive teaching practices, and worked collaboratively to design and present original learning scenarios.

Robots Meet Arts Teacher Training Programmes Across Europe

In **Spain** the training was conducted through the Moodle platform and consisted of a course that presented the program's content both theoretically, with materials such as text documents or videos, and through in-person, practical presentations of the methodologies, software and hardware that can be used for learning the arts and humanities through computational thinking and robotics.

In **Belgium** engaging training sessions were organized in November 7 and 12, in Leuven, Belgium. The aim was clear: to inspire teachers to integrate innovative teaching methods and materials across different learning areas in primary schools, while ensuring inclusivity for all learners — taking into account learning difficulties, gender, and language diversity. The training started with an introduction to the project's vision and objectives, highlighting how technology and creativity can work hand in hand to enrich classroom experiences.

Participants learned why these tools are not just gadgets but powerful instruments for fostering problem-solving, collaboration, and critical thinking. The importance of adapting activities to different learning styles so that every child can participate meaningfully was emphasized. Then, teachers worked in small, interactive groups to explore a variety of educational robots, including Photon, Talebot, Cubetto, Micro:bit, Edison, Indi-Sphero, Makey Makey and Scratch. These hands-on activities allowed participants to experiment with both plugged and unplugged approaches, directly connected to the lesson plans, which were shared via the Moodle platform. This practical component helped teachers see how robotics can be integrated into subjects like history, language, arts. The atmosphere was vibrant and collaborative. Participants exchanged ideas, shared best practices, and discovered creative ways to link robotics with their existing curricula.

TPM Thessaloniki (Greece)

Researchers' night (Spain)

Researchers' night (Spain)

TPM in Thessaloniki

On 23–24 October, the third Transnational Project Meeting of the Robots Meet Arts project was successfully held in Thessaloniki, Greece, hosted by Stimmuli for Social Change. During the meeting, project partners took part in a series of collaborative working sessions to review the overall progress of the project. Key discussions focused on achievements to date, the status of ongoing and planned actions, and the coordination of next steps, including the setting of concrete timelines and deadlines.

A central part of the meeting was dedicated to the testing of the curriculum activities, allowing partners to experience and reflect on the proposed learning scenarios from a teacher's perspective. In addition, partners engaged in in-depth discussions on the piloting of the curriculum in school settings, addressing practical aspects such as implementation conditions, teacher support, etc.

The meeting strengthened cooperation among partners and ensured a shared understanding of how the Robots Meet Arts curriculum will be effectively piloted and implemented in schools in the coming months.

URV's participation in the Researchers' Night

On September 26th in Tarragona and October 3rd in Tortosa, the European Researchers' Night was celebrated. Under the title "**Creative Robots, Technological Artists,**" various activities were presented aimed at developing computational thinking through plugged and unplugged proposals, within the framework of the Robots Meets Arts project. Throughout the workshops, nearly 5,000 people participated, mostly children and adolescents, who were able to experiment and enjoy the proposed activities.
