CODE COLLAGE CRAZE

**Subject:**

Arts & Design - Art history

Content:

Collage art, crafting

**Computational practices:
choose what fits**

- **Decomposing**
- Pattern recognition
- Abstraction
- **Algorithms**
- Problem solving

Unplugged/plugged:

**Preparation time:**

10 min

**Age:**

8-12 years

**Duration:**

60 min

**Location:**

Classroom, art room

**Group distribution:**

Groupwork in groups of 2

**Difficulty****After this lesson, the children will be able to...**

- The children will be able to understand and practice spatial awareness concepts (e.g., left, right, in front, behind, etc.) and describe the position of objects using spatial language.
- give step-by-step instructions in a logical sequence.
- identify the importance of giving clear, unambiguous directions.
- listen carefully to their peers' instructions and follow them to create a similar collage.
- understand how giving and following instructions relates to programming and algorithms
- find pleasure and satisfaction in visual design and enjoy what has been visually designed.
- apply techniques and use tools and materials to give visual form in ways that satisfy them.
- express tactile, visual impressions, experiences, feelings and fantasies in a visual way.

Materials needed:

- Projector + laptop or the picture printed for each group
- Stack of coloured paper
- 2x glue sticks
- 2x A4 paper
- 2x pencils
- 1x eraser
- 1x sharpener

Helpful links:

Sandwich bot: <https://www.youtube.com/watch?v=leBEFaVHlIE&t=77s>

Preparation and teacher notes

Before starting the lesson, cut out 2 sets of figures
For example: 2x triangle, 2x square, 2x hexagon, 2x circle.

Place 2 pencils and 2 A4 sheets of clear paper close by.

Would you rather work around another collage artist? Here is a list of artists who also make collage art.

- Hannah Höch
- Kurt Schwitters
- Eduardo Paolozzi
- ...

If the children give too many/confusing instructions, as a teacher you can always say Error! This means the children have to improve their instructions.

Tips:

- Give clear short instructions.
- Instructions are given in the correct order.

Warm up 15'

Today we are going to create artworks inspired by the artist Henri Matisse. Then project this (the two masks) artwork onto the board.

Interesting questions:

- What do you see?
 - Child's own answer.
- What material is it made of?
 - Coloured paper.
- How do you think the artist worked
 - He cuts different shapes from coloured paper, then glued these shapes on a paper.

Program the teacher:

Give the children 1 A4 paper, 1 glue stick and 1 set of figures. The teacher has the same materials.

The children are given a few minutes to create a work of art with their figures. The teacher is not allowed to see the artwork during/end of the process.

When the children have finished creating their artwork, they will start programming the teacher using clear instructions. The aim is for teacher to be able to create the same artwork as the children's using these instructions.

Reflection:

- What went well?
- What went wrong?
- How can we do better next time?

The following computational skills were introduced

- Decomposing: Taking a big problem and splitting it into smaller pieces so it's easier to understand and solve
- Algorithms: Algorithms are like step-by-step instructions to solve a problem or do a task. They help computers know what to do

Preparation and teacher notes

Each group will receive the following materials.

- 2x scissors
- Stack of coloured paper
- 2x glue sticks
- 2x A4 paper
- 2x pencils
- 1x eraser and 1x sharpener

Differentiation:

- To make oral instructions easier, have the children work with geometric shapes first.
- Give the artist a max number of instruction it can use.
- Have the artist write down the instructions on paper.
- Use organic shapes instead of known geometric shapes.
- Use more/less figures to make the task easier or more difficult

Build up 15'

The children are divided into groups of 2. Each child then cuts 2 identical sets of figures. These always have the same shape, size and colour.

For example:

- 2x red square
- 2x blue circle
- ...

Then each child makes a work of art with 1 set of figures and glues it onto an A4 paper with a glue stick.

Note: The children are not allowed to see each other's artwork.

Rehearsal 20'

For this part, the children sit with their backs to each other so they cannot see each other's sheet.

One child becomes the artist and the other child the forger. The artist gives clear instructions to the forger. The forger tries to carry out these instructions to the best of his ability. The aim is to recreate the artist's artwork as well as possible without seeing it but with instructions from the artist. The children compare the "work of art" and the "forgery". Does the forger completed the test or not?

Then the children switch roles.

Clean up 10'

The children clean up the scraps and other materials and place them in the right spot.

Finally, a small exhibition is set up where the works are displayed.

Preparation and teacher notes

You can implement the following suggestions in your lesson. This allows you to adjust the level of difficulty through small modifications.

Adapting Activities to Increase Difficulty

Number of Shapes:

- Allow children to use more or fewer shapes in their artwork. The more shapes they incorporate, the more challenging the task becomes.

Types of Shapes:

- You can start by having children use geometric shapes in their work (e.g., square, circle, hexagon). These shapes are easier to name, which helps children link the correct "program" to the appropriate shape more easily.
- To increase the difficulty, children can be asked to avoid using recognizable shapes and instead create their own. These invented shapes are harder to name, making it more challenging to give clear instructions.

Use of Color:

- Limit the number of different colors children are allowed to use – for example, a maximum of three colors. This prevents them from simply referring to the color of a shape to link it to a specific "program," encouraging more precise and abstract descriptions.

Limiting the Number of Instructions:

- Set a maximum number of steps or sentences children can use in their program – for example, 10. You can also turn it into a challenge by seeing who can achieve the desired result using the fewest instructions.
- Additionally, you can ask them to write down their steps on paper before handing them to the "executor" of the program.

Peeking (Hints):

- If the task becomes too challenging, allow children a limited number of "peeks" – for example, three. During a peek, they can look behind the screen at the other child's work. They may then adjust their program or instructions based on what they observed.
