Act green, think fair

**Subject:**

Civic and moral education

Content

Global awareness and moral responsibility

Sense of environmental justice

**Computational practices:
choose what fits**

- Algorithms
- Problem solving

Unplugged/plugged:
plugged

**Preparation time:**

60- 90 min

**Age:**

8-9 years old

**Duration:**

80 - 90 min

**Location:**

school, any classroom

**Group distribution:**

groups of 3-4 students

**Difficulty****After this lesson, the children will be able to...**

- Identify the importance of SDG 13 and climate change.
- Develop computational thinking through Blue-Bot programming.
- Promote teamwork and shared decision-making.
- Recognize everyday actions that contribute to environmental sustainability.
- Connect technology with positive actions for the planet.

Materials needed:

- **Floor mat** (5x5 floor mat with 15 cm squares): There will be photographs of climate-friendly actions (these are actions that help take care of the planet, reduce pollution, and contribute to slowing down climate change) and climate-unfriendly actions (these are actions that cause pollution, waste resources, or contribute to environmental degradation). You can use the grid in the Annex 2 as an example for your mat.
- **Blue-bot** for each student group.
- **Cards** with climate-friendly and climate-unfriendly actions (Annex 1)
- **Optional** recommendation:
 - One **tablet** per group with the Blue-Bot app installed
 - **Photo of the mat uploaded** to the app to enable the digital view
 - **Blue-Bot connected** via Bluetooth to allow remote programming

Preparation and teacher notes

Create a large grid on the floor using tape or paper or print the example grid found in the Annex. (1 large floor grid - per group)

Floor mat 5x5 floor mat (with 15 cm squares): In each pocket of the carpet, there is a photograph that represents either a climate-friendly or a climate-unfriendly action.

Make sure you have enough charged robots in advance.

Warm up 20'

An initial conversation is held about what climate change is and why it is a problem.

SDG 13 is presented using visual resources and short, age-appropriate videos. (<https://youtu.be/jhoa3OHivN8?si=wI24E6ktV90AonDy>)

The Blue-Bot is introduced as an "environmentalist robot" that needs help to find sustainable actions and avoid pollution.

Preparation and teacher notes

Organize students into small groups (3-4 students) and encourage teamwork and clear communication.

Important note

Clarify what is meant by “move right.” To move right the robot turn 90 degrees to the right and stay on the same square. To make the robot move to the square on the right, the students need to use a move right and the a move forward. It’s important that this is clearly explained to the children, as there is a risk they may interpret the program differently from the intended instruction. In many educational robots, turning right means rotating 90 degrees without changing squares.

Build up 20'

Programming and Play:

Each group receives a challenge: to program the Blue-Bot to visit three sustainable actions while avoiding two negative ones.

They must plan the route, test it, and make corrections if needed.

They can write down the routes and make predictions before testing.

Rehearsal 20' (whole class)

- When all the teams are ready, they present their robot’s journey through the climate-friendly actions to the whole class, using the large floor grid. As the robot moves, the students in the group narrate the actions the robot passes over.
 - If the robot reaches an incorrect location, the class helps the group troubleshoot by providing feedback on the robot’s programming. The class identifies movement patterns and suggests improvements to simplify the instructions and shorten the algorithm.
- 

Preparation and teacher notes

🎨 Materials for the mural or infographic

- Large poster boards or mural paper (divided into two sections: positive and negative actions).
- Printed photographs of actions related to climate change (e.g., recycling, wasting water, cycling, single-use plastics, etc.).
- Magazines or catalogs for cutting out images.
- Art supplies: markers, colored pencils, scissors, glue, stickers, etc.
- Labels or sticky notes to write short descriptions of actions.
- Digital devices (optional): for creating a digital infographic using tools like Canva or Google Slides, if appropriate for the age group.

Clean up 20' (whole class)

To conclude the Blue-Bot activity on SDG 13 (Climate Action), we suggest creating a mural or infographic that highlights the difference between climate-friendly and climate-unfriendly actions.

Each group of students can contribute by selecting images or drawing representations of actions they explored during the activity. These can include actions the Blue-Bot visited on the grid. The mural or infographic should have two clear sections:

- Climate-friendly actions – such as recycling, walking or biking instead of using a car, saving water, or planting trees.
- Climate-unfriendly actions – such as littering, wasting electricity, using single-use plastics, or polluting water.

This visual representation will help consolidate learning, reinforce vocabulary, and encourage discussion. It also gives students a sense of ownership and pride in contributing to a shared classroom display focused on sustainability.

This final step serves both as a reflection on the activity and a communication tool to share what they've learned with others in the school community.

Annex 1: Climate actions

✓ Climate-friendly actions (good for the planet):

- Walk or bike to school.
- Turn off lights when they're not needed.
- Use reusable water bottles.
- Recycle and sort waste properly.
- Reuse paper or materials for crafts.
- Use cloth bags instead of plastic ones.
- Plant trees or take care of plants.
- Save water when washing hands or brushing teeth.

✗ Climate-unfriendly actions (bad for the planet):

- Throw plastic on the ground or into the sea.
 - Leave electronic devices on when not in use.
 - Use the car for very short trips.
 - Buy many things we don't really need.
 - Waste materials or throw away food.
 - Use many single-use products (like plastic cups or paper napkins).
 - Cut down trees without replanting.
- 

Annex 2: Example of the floor mat.

Hi! Do you help me to save the planet?
